#### Abstract

This presentation focuses on several aspects of the Lister Hill transcript that were *not* clearly stated during the two-day presentation held October 11-12, 1999. Topics discussed include: (1) Thimerosal has not been proven “sufficiently non-toxic”, (2) Thimerosal is *not* an effective bactericide, (3) Thimerosal is a strong antigen adjuvant, (4) how Thimerosal results in lower manufacturing costs, (5) how “antigen adjuvancy” causes hidden health costs, (6) disinformation on Thimerosal “half-life”, (7) Thimerosal (Merthiolate), ethylmercury hydroxide, and “inorganic mercury” are toxic in humans at “tissue” levels below 0.02 ppm, (8) “Thimerosal preserved” vaccines were known to be toxic to babies years before 1999, and (9) managing the continued use of “Thimerosal preserved” vaccines.
